App listing categories

Install AI Toolkit Ask about this page Copy MD

App categories, subcategories, and tags allow merchants to find apps that meet their specific needs.

You need to categorize your app on the app listing form. A primary tag is required, and should represent your app's main function. You can add a secondary tag if the primary doesn't fully describe your app's function. For example, if your app manages email marketing and SMS marketing, you should add tags for both of these functions. If your app is mainly for email marketing and only has a small SMS marketing features, then you should add only the email marketing tag.

As part of the app review process, Shopify app review team will review and confirm that your app is classified accurately.

We regularly review app classification as a part of our taxonomy governance. Ongoing governance can also result in changes to the taxonomy. Both of these activities could result in changes to the categories, subcategories, and tags applied to an app.

> **Tip**
> To discover categories applicable to your app, research apps that are similar to yours on the Shopify App Store and use the categories that they use.

The Shopify App QA team will continue to be involved to ensure that apps are classified accurately.

If your app capabilities change and you want to change how your app is categorized, then you can submit an appeal to change the app categorization by using the link in the app submission form. After the Shopify app review team completes their review, they'll send a response, whether it's approved or rejected.

App category details

Each category requires additional structured features about your app. This makes it easier for merchants to identify and compare relevant app features by category.

You can select up to 25 structured features per category field in the app submission form and they will appear on the app listing. These details can be updated at any time and don't require an appeal for review.

We've curated the most common features that merchants might be looking for within each category. If your app has more functionality than what's listed for each category, then consider either using your features list to specify the functionality or let us know in this feedback form.

List of app categories, subcategories, and tags

Apps can be assigned to one of the following categories:

- Sales channels
- Finding products
- Selling products
- Orders and shipping
- Store design
- Marketing and conversion
- Store management

Each category is divided into subcategories, and each subcategory has multiple tags associated with it.

Categories	Subcategories	Tags
Sales channels: Apps that let merchants sell to customers using sales channels.	**Selling online**: Apps that let merchants sell across online platforms.	**Marketplaces**: Apps for publishing products on online marketplaces.
		Product feeds: Apps that let merchants use structured data files to manage product information.
